

## FAQS

- Design has been completed; permits are in the works; no dredging/restoration funding has been secured.
- The project is broken into 3 phases. Page 2 of the Project Brochure shows the general areas of the phases.
- Lake dredging maintenance cycles are recommended in 15–20 year periods for the Morning Glory end of the Lake. It is expected that dredging maintenance cycles at the Susquehanna Spillway area will be much less frequent.
- The timeframes for dredging maintenance will vary based upon weather patterns and upstream stream restoration activities performed by others.
- If nothing is done, the flood mitigation capacity of the lake for the benefit of the City of Harrisburg will continue to decrease, the risk of potential damage to Wildwood Way/the dam breast during major flood events will increase, the amount of habitat will continue to decrease for aquatic animals, and the population of invasive plants will continue to increase.
